READING DR: HOWARD A GRIFFIN , MD

PROCEDURE: **09/28/09 Chest (Adult PA & Lateral)** **71020**

FULL RESULT:

PA and lateral views of the chest were done and compared with the portable film of 25 June 2008.

On today's study the trachea is midline and the diaphragm is smoothly outlined. The heart is not enlarged. The changes of a sternal splitting thoracotomy are again seen. The left venous access port catheter remains in place. The mass in the right hemithorax along the mediastinum is again seen and is slightly smaller and the infiltration is less prominent. The lungs are clear of active inflammatory disease and no pleural effusion is seen.

IMPRESSION:
1. NO ACUTE CARDIOPULMONARY DISEASE RADIOGRAPHICALLY.
2. THE MASS ALONG THE MEDIASTINUM IN THE RIGHT HEMITHORAX IS AGAIN SEEN BUT IS SMALLER.
3. LEFT VENOUS ACCESS PORT CATHETER.
4. POST STERNAL SPLITTING THORACOTOMY.
